Upper Rum River Watershed Management Organization  
9900 Nightingale Street NW  
Oak Grove, MN 55011-9204

## I. Introduction

This report has been prepared to meet the annual watershed management organization reporting requirements of Minnesota Rules 8410.0150. The report is intended to fulfill 2023 reporting requirements.

The Upper Rum River Watershed Management Organization (URRWMO) is a joint powers organization under Minnesota Statutes, Section 471.59. It is comprised of the cities of Bethel, Oak Grove, Nowthen, and St. Francis, and portions of the cities of East Bethel and Ham Lake. Board members are appointed by the member cities. The organization's direction is laid out in its watershed management plan and the member municipalities' local water plans. The URRWMO meets approximately every other month on the first Tuesday at 6:30pm at Oak Grove City Hall, Minnesota.

## II. Activity Report

### a. Current Board Members

#### CITY OF BETHEL

Ryan Sequin  
PO Box 63  
Bethel, MN 55005  
612-910-8385  
rmsequin@gmail.com

Patrick Sullivan  
181 Broadway St  
Bethel, MN 55005  
612.747.6113  
pbsgolfer@yahoo.com

#### CITY OF EAST BETHEL

Tim Miller  
2241 221<sup>st</sup> Ave NE  
East Bethel, MN 55011  
612.387.6600  
tim.harrington@ci.east-bethel.mn.us

Radja Lohse  
charlotteandre@usfamily.net

#### CITY OF HAM LAKE

Brian Kirkham  
15544 Central Ave NE  
Ham Lake, MN 55304  
612.978.2764  
bkirkham@ci.ham-lake.mn.us

Jeff Entsminger  
14916 Central Ave NE  
Ham Lake, MN 55304  
612.669.4004  
jeff@allseasonservices.com

#### CITY OF NOWTHEN

Dan Breyen (Vice Chair)  
19093 St. Francis Blvd NW  
Nowthen, MN 55303  
612.470.2234  
dnbreyen@gmail.com

Shanni Fladebo  
8188 199<sup>th</sup> Ave NW  
Nowthen, MN 55330  
763.772.8233  
shanni2in2@gmail.com

#### CITY OF OAK GROVE

Paul Tradewell (Treasurer)  
990 192<sup>nd</sup> Ave NW  
Oak Grove, MN 55011  
612.910.7577  
pault@ci.oak-grove.mn.us

John West (Chair)  
19900 Nightingale St NW  
Oak Grove, MN 55011  
612.414.3513  
jwest@ci.oak-grove.mn.us

#### CITY OF ST. FRANCIS

Andrew Wood  
3419 236<sup>th</sup> Lane NW  
St. Francis, MN 55070  
217.414.9017  
Ajwood600@gmail.com

Chris Beyett  
23537 Eidelweiss St NW  
St. Francis, MN 55070

chris.beyett@gmail.com

**b. Day to Day Contact**

The day to day contact persons for the URRWMO who can answer questions about the organization are:

John West, Chair  
 612.414.3513  
 jwest@ci.oak-grove.mn.us

**c. Employees and Consultants**

The URRWMO does not employ staff, but does utilize consulting services and enters into cooperative agreements with other government agencies. A description of contracted services is listed below:

Consultant/Partner	Contact	Work Description
Anoka Conservation District	Jamie Schurbon Watershed Projects Manager 1318 McKay Drive NW, #300 Ham Lake, MN 55304 763-434-2030 ext. 210 jamie.schurbon@anokaswcd.org	<ul style="list-style-type: none"> <li>• Administrative assistance.</li> <li>• Water quality and hydrological monitoring, and special studies.</li> <li>• Website maintenance.</li> <li>• Public outreach/education.</li> <li>• Assistance preparing annual reports to BWSR.</li> <li>• Assistance reviewing local water plans.</li> </ul>
TimeSaver Offsite Secretarial	Carla Wirth 21021 Karoline Court N Forst Lake, MN 55025 612-251-8999 Timesaver.secretarial@gmail.com	<ul style="list-style-type: none"> <li>• Recording secretary for meetings.</li> </ul>

**d. Solicitations for Services**

Minnesota Statutes 103B.227 require watershed management organizations to solicit bids for professional services at least once every two years. Most recently the URRWMO completed a proposal request for a watershed coordinator, water monitoring, and similar work in each 2021 & 2023. Requests for proposals were sent to consulting engineers for member communities and the Anoka Conservation District (ACD). One proposal was received in each year, from ACD. ACD was selected. Also in 2023, a process was conducted to solicit bids for secretarial services, and Timesaver was selected. Previous to these efforts, the URRWMO has requested similar proposals every two years.

**e. Water Quality Trends**

The URRWMO has a long term water quality monitoring program that includes most larger streams and recreational lakes in the watershed. Many waterbodies are monitored every 2-3 years. An important part of evaluating implementation of the watershed management plan is looking at water quality trends. Data for each waterbody monitored are provided in **Appendix B**.

The only waterbody with a statistically significant water quality trend in the watershed is Lake George. Long term (1980-present) the lake has a trend of reduced transparency but no trend for other parameters. The trend is slow and modest. Within the record, there are period of time, such as 2011-2021 when water quality is improving but nonetheless the longer term picture is of overall gradual decline in transparency. Detail of this trend analysis is contained in **Appendix B** and the Rum River Watershed Restoration and Protection Strategies Report (see MPCA website). Research by the Anoka Conservation District has found that consecutive years of high precipitation result in decreased clarity, and those wet years have become more frequent. Lake George was most recently monitored in 2023.

**Lake George Secchi Transparency.** Includes years with partial datasets not covering all open water months. Those years are excluded from ACD’s statistical trend analysis found in the appendix of this graph.

The URRWMO also is interested in how the Rum River’s water quality changes longitudinally, particularly within its jurisdictional boundary. The Rum River is monitored periodically approximately where it enters and exits the URRWMO. The figures below summarize annual average phosphorus and suspended solids including

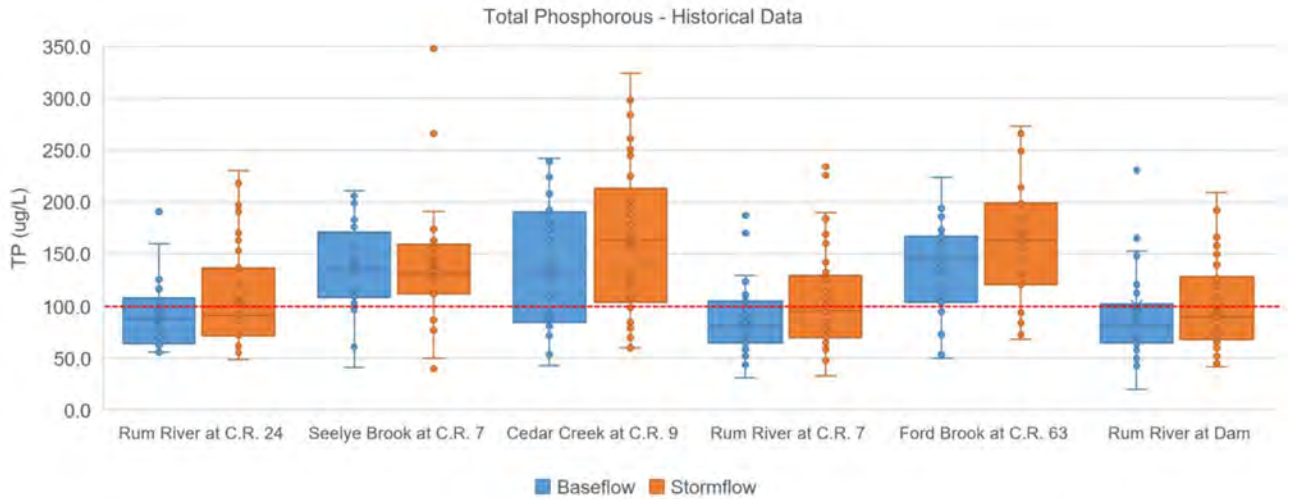

the most recent monitoring in 2023. Overall, these key pollutant concentrations are the same in the river when it enters and exits the URRWMO. Suspended solids are well below state water quality standards. Phosphorus is near, but below, state water quality standards. For example, at County Road 7 the average TP across all years monitored is 87.2 µg/L during base flow and 104.5 µg/L during storms. The state standard is 100 µg/L. Phosphorus reductions remain an important goal of the URRWMO and other partners throughout the greater Rum River watershed.

The URRWMO further investigates the impact of their jurisdictional area on water quality by monitoring Rum River tributaries: Seelye Brook, Cedar Creek, and Ford Brook. Monitoring, most recently in 2023, found that these tributaries all have slightly higher than desired phosphorus. In 2023 across all conditions (storms and baseflow) at the farthest downstream monitoring sites averaged 129.0 µg/L at Cedar Creek, Seelye Brook 128.8 µg/L, and Ford Brook 160.5 µg/L.

**Average total phosphorus for the Rum River and tributaries.** Baseflow and storm conditions are shown for each monitoring site from upstream to downstream. The Rum River at C.R. 24 and at C.R. 7 sites approximate the top and bottom of the URRWMO.

**Average suspended solids for the Rum River.** Baseflow and storm conditions are shown for each of three monitoring sites from upstream to downstream. The upstream (left) and middle sites approximate the top and bottom of the URRWMO.

Additional water quality data is available online. Annual watershed monitoring reports are available on the URRWMO website ([www.URRWMO.org](http://www.URRWMO.org)). All water quality data collected by the URRWMO is on the MN Pollution Control Agency’s EQulS database, which is accessible through their website.

**f. Evaluation of Watershed Management Plan Implementation and 2024 Work Plan**

The current URRWMO Watershed Management Plan was approved by the Minnesota Board of Water and Soil Resources (BWSR) in 2019. The watershed plan contains goals, policies a detailed water monitoring schedule, and a project implementation schedule. The tables on the following page compare planned work to accomplished work for the most recent two years plus list planned work for the upcoming year. There are separate tables for URRWMO work and member community work.

**URRWMO Implementation - URRWMO work planned and accomplished by the URRWMO to fulfill the 3rd Generation URRWMO Watershed Management Plan. Last 3 years only are shown; others available upon request.**

<b>URRWMO TASK CHECKLIST</b>

Note: List includes only tasks with tangible deliverables.

**g. Status of Local Ordinances, Plan Adoption and Implementation**

All URRWMO member cities have updated their local water plans for consistency with the 3rd Generation URRWMO Watershed Management Plan. The URRWMO approved those city plans during 2019-2021.

Similarly, the URRWMO has reviewed local ordinances to ensure they are consistent with URRWMO minimum standards. As of December 2023, all ordinances have been found consistent except Bethel. Bethel finalized their ordinance updates in January 2024. All are now complete.

To track member cities’ progress on local plan implementation, the URRWMO requires a brief annual report from each city and provides a template for this report. In addition to serving as a reporting tool, the template serves as a “to do” list for our cities. These reports are available upon request, and are summarized in the table below.

**Status of city local water plans and some recent accomplishments toward plan implementation.**

<b>City of Bethel</b>	
<b>Submitted 2023 annual report to URRWMO?</b>	No
<b>Local Water Plan Status</b>	Bethel’s local water plan was approved by the URRWMO in 2019.
<b>Ordinances Status</b>	The City was asked to review ordinances in 2020 for compliance with local, state and federal minimum requirements. That task is ongoing in 2023.
<b>Some Recent Implementation Accomplishments</b>	No reporting to the URRWMO has been submitted since 2015.
<b>City of East Bethel</b>	
<b>Submitted 2023 annual report to URRWMO?</b>	Yes
<b>Local Water Plan Status</b>	East Bethel’s Local Water Plan was approved by the URRWMO in November 2020.
<b>Ordinances Status</b>	The City has reviewed URRWMO-required ordinances for compliance with local, state and federal minimum requirements. The city has all required ordinances at or above minimums. Ordinances include construction site erosion control, post-construction stormwater management, floodplain, wetlands, shoreland and wellhead. Review date: 2/2020.
<b>Some Recent Implementation Accomplishments</b>	<ul style="list-style-type: none"> <li>• Culvert inventory, a requirement of the 3<sup>rd</sup> Generation URRWMO plan, is complete and stored on the Anoka County online Water Resources Mapping tool.</li> <li>• Annual inspection of all outfalls and skimmers and 1/5<sup>th</sup> of stormwater ponds.</li> <li>• Compliance with MPCA NPDES rules.</li> <li>• Work to complete BMP’s in the City’s Storm Water Pollution Prevention Plan.</li> </ul>

	<ul style="list-style-type: none"> <li>• Educational efforts by website and thee newsletter articles reaching 4,550 residents about wetland buffers, groundwater protection, water conservation, hazardous waste disposal, habitat, and activities of the URRWMO.</li> <li>• Sweep all streets draining to Coon Lake and Crooked Brook in spring and fall.</li> <li>• Educational efforts by website and newsletters reaching 4,550 residents about wetland buffers, groundwater protection, water conservation, hazardous waste disposal, yard waste management, and the URRWMO.</li> </ul>
<b>City of Ham Lake</b>	
<b>Submitted 2023 annual report to URRWMO?</b>	Yes
<b>Local Water Plan Status</b>	The URRWMO approved the City of Ham Lake Local Water Plan September 14, 2021.
<b>Ordinances Status</b>	The City has reviewed URRWMO-required ordinances for compliance with local, state and federal minimum requirements. The city has all required ordinances at or above minimums, primarily by referencing URRWMO standards. Ordinances include construction site erosion control, post-construction stormwater management, floodplain, wetlands, shoreland and wellhead. Review date: 2019.
<b>Some Recent Implementation Accomplishments</b>	<ul style="list-style-type: none"> <li>• Culvert inventory, a requirement of the 3<sup>rd</sup> Generation URRWMO plan, is complete. However, the inventory is not stored on the Anoka County online Water Resources Mapping tool as recommended by the URRWMO technical advisory committee and required by the URRWMO.</li> <li>• Annual inspection of 20% of all ponds and outfalls and 100% of structural BMPs.</li> <li>• Educational efforts by website, newsletters, and workshops reaching 6,458 households about hazardous waste disposal, water quality improvement, and water conservation.</li> <li>• Routine inspection of land disturbance activities and requiring erosion and sediment control plans.</li> <li>• Street sweeping twice per year, minimum.</li> <li>• Ongoing work to complete BMP's in the City's Storm Water Pollution Prevention Plan.</li> </ul>
<b>City of St. Francis</b>	
<b>Submitted 2023 annual report to URRWMO?</b>	No
<b>Local Water Plan Status</b>	St. Francis' Local Water Plan was approved by the URRWMO in 2020.
<b>Ordinances Status</b>	The City has reviewed URRWMO-required ordinances for compliance with local, state and federal minimum requirements. The city has all required ordinances at or above minimums. Ordinances include construction site erosion control, post-construction stormwater management, floodplain, wetlands, shoreland and wellhead. Review date: 2/2020.
<b>Some Recent Implementation Accomplishments</b>	<ul style="list-style-type: none"> <li>• Culvert inventory, a requirement of the 3<sup>rd</sup> Generation URRWMO plan, was completed in 2017 and updated in 2022. The inventory has been added to the Anoka County online Water Resources Mapping tool as recommended by the URRWMO technical advisory committee and required by the URRWMO.</li> <li>• Annual inspection of all outfalls and skimmers and 1/5<sup>th</sup> of all ponds. No IDDE issues were found; some regular maintenance issues were identified.</li> </ul>

	<ul style="list-style-type: none"> <li>Educational efforts by website and newsletters reaching 7,200 residents about AIS, water conservation, hazardous waste disposal, yard waste, pet waste, and the URRWMO.</li> </ul>
<b>City of Nowthen</b>	
<b>Submitted 2023 annual report to URRWMO?</b>	Yes
<b>Local Water Plan Status</b>	The URRWMO approved Nowthen’s local water plan in 2019.
<b>Ordinances Status</b>	The City has reviewed URRWMO-required ordinances for compliance with local, state and federal minimum requirements. The city has all required ordinances at or above minimums. Ordinances include construction site erosion control, post-construction stormwater management, floodplain, wetlands, shoreland and wellhead. Review date: 2/2020.
<b>Some Recent Implementation Accomplishments</b>	<ul style="list-style-type: none"> <li>Culvert inventory, a requirement of the 3<sup>rd</sup> Generation URRWMO plan, was completed in 2008 and updated in 2022. It was recently added to the Anoka County online Water Resources Mapping tool as recommended by the URRWMO technical advisory committee and required by the URRWMO.</li> <li>Annual inspection of all outfalls and skimmers and 1/5<sup>th</sup> of all ponds. No IDDE issues were found; some regular maintenance issues were identified.</li> <li>Educational efforts by website and newsletters reaching 2,300 residents about hazardous waste disposal and the URRWMO.</li> </ul>
<b>City of Oak Grove</b>	
<b>Submitted 2023 annual report to URRWMO?</b>	Yes
<b>Local Water Plan Status</b>	The URRWMO approved Oak Grove’s local water plan in 2019.
<b>Ordinances Status</b>	The City reported in November 2020 that city ordinances had been reviewed and were consistent with URRWMO minimums.
<b>Some Recent Implementation Accomplishments</b>	<ul style="list-style-type: none"> <li>2023 inspections of 23 of their 128 ponds and all 18 stormwater outfalls.</li> <li>A culvert inventory was completed in 2023.</li> <li>Educational efforts by website &amp; newsletters reaching 3,086 households about hazardous waste disposal, water quality improvement, MS4 programs, and the URRWMO.</li> <li>Reviewed erosion and construction ordinances in 2022 for compliance with new MS4 permit.</li> </ul>

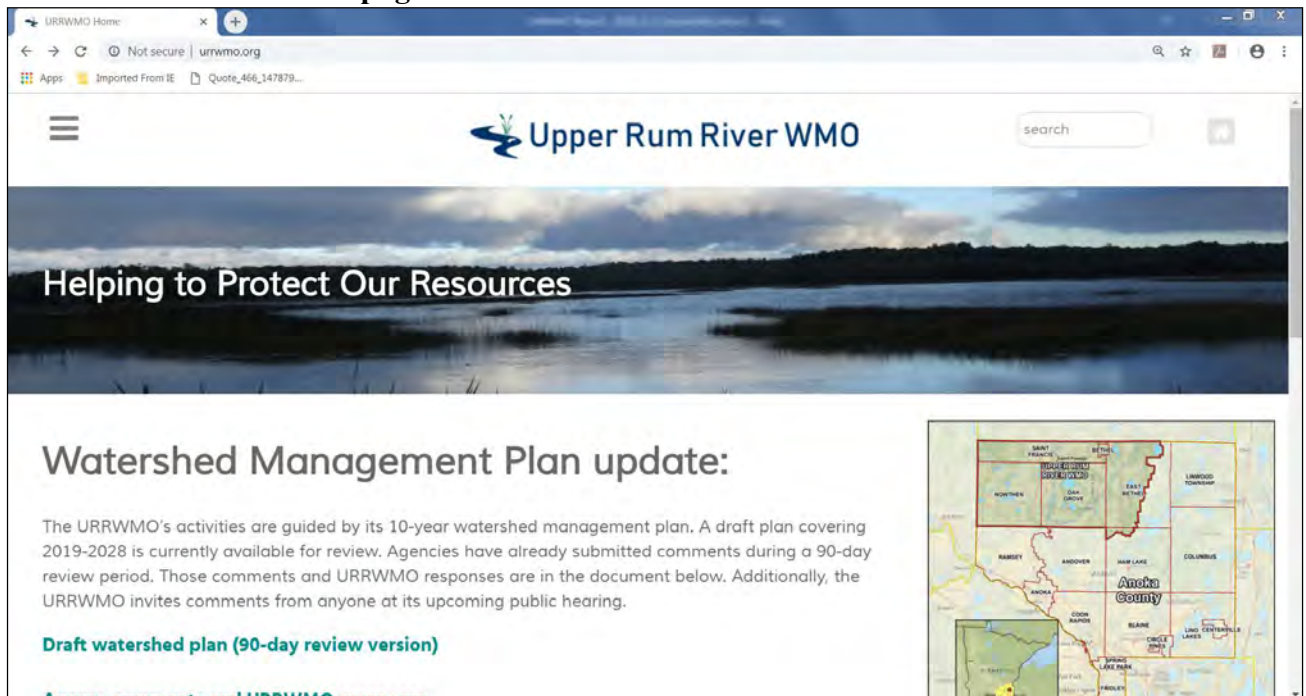

## h. Public Outreach

The URRWMO and its member cities do periodic public outreach and education projects. The URRWMO’s website serves as the primary, continuous public outreach tool while other outreach is more targeted. Website contents include general information about the organization, the watershed management plan, meeting agendas and minutes, water monitoring results, profiles of WMO projects, access to mapping and data access tools, and others.

The URRWMO ensures visibility of its website by asking member cities and townships to post the URRWMO website address in their newsletters. Links to the URRWMO website are also provided through other websites including the Anoka Conservation District and member municipality websites.

The website address is <http://www.urrwmo.org>

### URRWMO Website homepage

In recent years the URRWMO contributed to a partnership that has produced animated videos to educate the public about water resources issues. The videos were produced by the Anoka County Water Resource Outreach Collaborative. The videos are available on the AnokaSWCD YouTube channel include:

- Part One: “Our Groundwater Connection”
- Part Two: “Our Groundwater Connection: Contamination”
- Our Lakeshore Connection
- Our River Connection
- Rain Gardens 101

Additional public outreach is accomplished through annual newsletter articles. The articles are distributed to member communities for distribution in their newsletters. Articles were printed in city newsletters, and are shown in Appendix B.

**i. Permits**

The URRWMO does not issue permits, variances, or take enforcement actions. These responsibilities are held by the member municipalities.

### III. Financial and Audit Report

**a. 2023 Financial Summary**

See Appendix A – 2023 Financial Report.

**b. Financial Audit**

The URRWMO is required to have an audit or agreed upon procedures engagement only once every five years in accordance with MN Statutes, section 6.756. The URRWMO last underwent an audit in 2020 for 2019 finances.

**c. 2024 Budget**

In June 2023 the URRWMO Board approved their 2024 budget as presented below.

**2024 ADOPTED Budget Detail**

**Notes:**

Budget was developed 2020-2029 SRWMO Watershed Management Plan.

Row Labels	Sum of 2024 Budget
<b>1 Non-operating</b>	
<b>2 Collaboration/Planning</b>	
3 Aerial photos	\$0.00
4	
<b>5 Education and Public Outreach</b>	
6 Anoka Co Outreach Coordinator Position	\$1,500.00
7 Website operations/maintenance	\$900.00
8 Rum River biomonitoring with St. Francis High School	\$0.00
9 Website platform update	\$0.00
10 URRWMO public education and outreach	\$1,131.00
11	
<b>12 Non-Operating General</b>	
13 Watershed Coordinator - Facilitate Technical Advisory Committee (TAC)	\$1,810.00
14 Watershed Coordinator - WRAPS review	\$0.00
15 Watershed Coordinator - Grant applications	\$1,288.00
16 5-year Watershed Plan Amendment per BWSR Requirement	\$0.00
17 URRWMO JPA Update	\$0.00
18	
<b>19 Water Quality Improvement Projects</b>	
20 Projects as detailed in the URRWMO 10-year Plan	\$16,557.00
21	
<b>22 Water Monitoring</b>	
23 Lake Level Monitoring	\$1,400.00

## 2023 Financial Report

UPPER RUM RIVER  
WATERSHED  
MANAGEMENT  
ORGANIZATION

FINANCIAL REPORT  
FOR YEAR ENDED  
DECEMBER 31, 2023

**To the Chairperson, John West, of the Upper Rum River  
Watershed Management Organization**

The enclosed statement has been prepared after review of the organization's financial records for 2020. I have not audited the organization's records and do not express an opinion. The enclosed information fairly reflects the Upper Rum River WMO's financial position for the stated year.

March 7, 2024

Prepared by:  
Jamie Schurbon, Anoka Conservation District  
1318 McKay Drive NE, suite 300  
Ham Lake, MN 55304  
763-434-2030

## STATEMENT OF REVENUES AND EXPENSES

For: year beginning January 1, 2023 and Ending December 31, 2023

<b>Expenditures</b>	<b>Amount</b>
<b>Administrative</b>	
Insurance - League of MN Cities Insurance Trust	\$2,283.00
Secretarial services	\$859.00
Watershed Coordinator operating expenditures including required reporting, mtg facilitation, and other - Anoka Conservation District (ACD)	\$7,004.00
SUBTOTAL	\$10,146.00
<b>Non-Administrative</b>	
Water monitoring - ACD	\$10,630.00
Water quality improvement grant projects - ACD	\$19,403.00
Public education and outreach – ACD	\$1,829.00
Watershed coordinator non-operating expenses	\$1,496.00
Other	
Other	
SUBTOTAL	\$33,358.00
<b>GRAND TOTAL</b>	<b>\$43,504.00</b>
<b>Revenues</b>	<b>Amount</b>
City of Bethel - 2023 contributions	\$2,254.01
City of Nowthen - 2023 contributions	\$9,865.71
City of East Bethel - 2023 contributions	\$9,738.57
City of Ham Lake - 2023 contributions	\$2,434.69
City of Oak Grove - 2023 contributions	\$11,769.48
City of St. Francis - 2023 contributions	\$8,751.56
LMCIT insurance dividends	\$174.00
<b>GRAND TOTAL</b>	<b>\$44,988.02</b>
<b>Retained Cash Reserves</b>	<b>\$1,484.02</b>
<b>Total Cash Reserves</b>	<b>\$19,575.20</b>

BALANCE SHEET

For the year beginning January 1, 2023 and ending December 31, 2023

<b>Assets</b>	
Cash	\$19,575.20
Accounts Receivable	\$0.00
Other	\$0.00

# *Recommendations*

- **Fund and install projects identified in the URRWMO Watershed Management Plan.** This prioritized list was created by the URRWMO Technical Advisory Committee:
  1. Rum Riverbank stabilizations\*
  2. Anoka County Water Resources Outreach Collaborative\*
  3. Perform stormwater retrofit analyses for the Rum River and subwatershed assessments\*.
  4. Lake George shoreline stabilizations\*
  5. Lake George iron-enhanced sand filter feasibility study
  6. Ditch 19 connector dredging

\* Indicates projects that have been initiated using State grant funds and URRWMO matching funds.
- **Maintain or reduce Rum River phosphorus.** Phosphorus levels are close to state water quality standards.
- **Protect Lake George water quality.** Measures include installing projects ranked in a 2022 study and ensuring robust stormwater retention/treatment for any new development in the subwatershed.
- **Complete ongoing Ford Brook and Rum River sub-watershed studies in 2024.** The studies identify and rank water quality projects. This is funded by a 2021 Rum Metro Watershed Based Implementation Funding (WBIF) grant.
- **In the East Twin and Pickerel Lake subwatersheds, protect undeveloped lands or implement rigorous water quality protection measures during development.** These lakes have good water quality and small drainage areas.
- **Promote Septic System Fix-up Grants** to landowners, particularly in shoreland areas. Grants are for low-income households.
- **Promote groundwater conservation and protection.** Metropolitan Council models predict 3+ ft. drawdown of surface waters in parts of the URRWMO by 2030, and 5+ ft. by 2050. This indicates conservation actions will be required to ensure the groundwater supply stays sufficient. Infiltration practices should be prioritized
- **Promote well sealing cost share grants** to landowners.
- **Promote practices that limit road deicing salt applications** while keeping roads safe. Streams throughout the URRWMO have increasing specific conductance. Requiring municipal plow drivers to become certified through MN Pollution Control Agency deicing courses is recommended.
- **Track activities of the Rum River Watershed Partnership.** That group developed a comprehensive plan for the watershed through the One Watershed, One Plan (1W1P) process and receives >\$1M in state funds biennially to implement it. The URRWMO is not a member, but may wish to track activities in the upper watershed or collaborate.
- **Accelerate planned Rum River monitoring in 2026-2027 to occur in 2025.** In this way it will occur at the same time and be comparable to once-every-ten years monitoring of tributaries by the MN Pollution Control Agency.

# Monitoring Sites: Upper Rum River Watershed

# *Lake Levels Monitoring*

**Partners:** URRWMO, ACD, MN DNR, Volunteers

**Description:** Staff gauges were installed by Anoka Conservation District (ACD), surveyed by the MN DNR, and monitored by weekly by local volunteers. The past five and twenty-five years of data (if available) for each lake are illustrated below, and all historical data are available on the Minnesota DNR website using the “LakeFinder” feature (<https://www.dnr.state.mn.us/lakefind/index.html>). The Ordinary High Water Level (OHW) is listed for each lake on the corresponding graphs below. Anything work occurring below this elevation requires a DNR permit.

**Purpose:** To understand lake hydrology, including the impact of climate or other water budget changes. These data are useful for regulatory, building/development, and lake management decisions.

**Location:** East Twin, Coopers, Minard, and Lake George

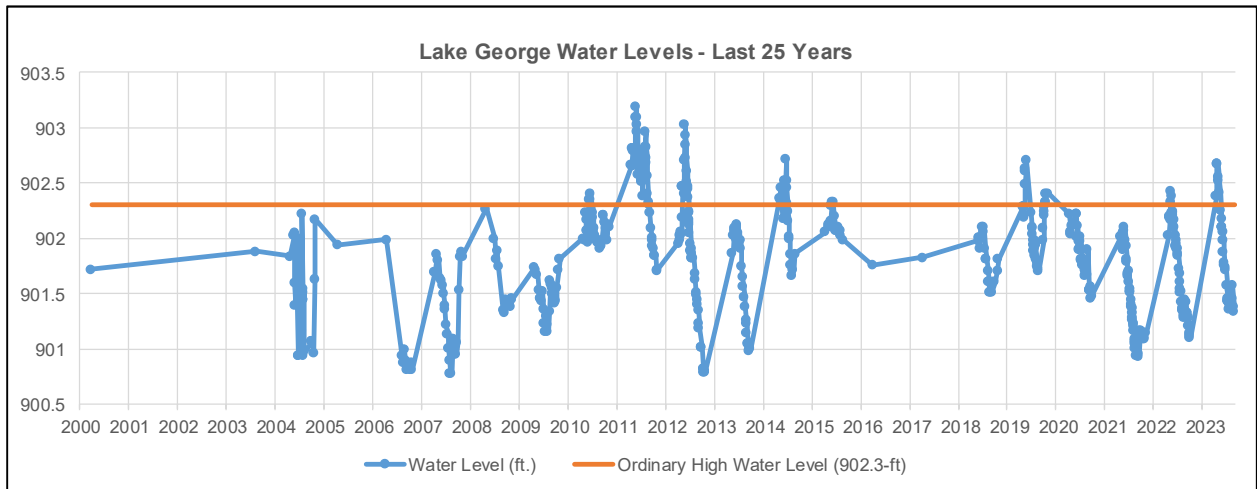

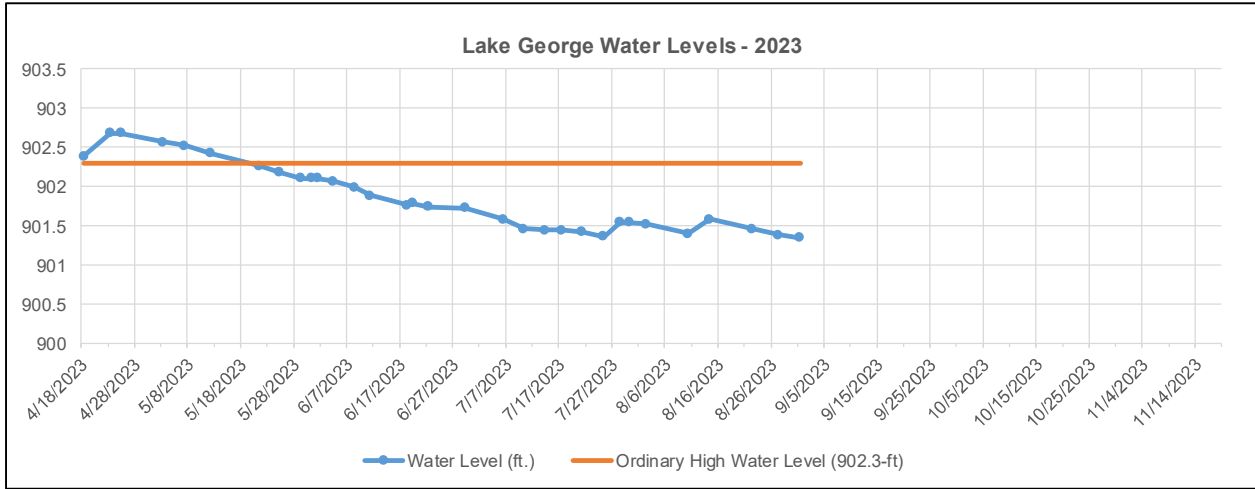

**Results:** **Lake George.** In spring 2023, Lake George had the fifth highest water levels in the last 23 years. Drought conditions developed the remainder of the growing levels, and water levels dropped 1.34 feet. Overall, water levels were within the range observed in the past, but water levels this high and low are observed every five years, on average.

**Coopers Lake.** In 2023, Coopers Lake also had high spring water levels. The lake dropped 3.62 feet during drought the remainder of the growing season. ACD was unable to secure a volunteer at Coopers Lake in 2023, so ACD used a calibrated data logger that collected lake water level data at 24-hour intervals. The lowest observed reading in 2023 was 917.84 feet – this is the second lowest reading since lake level monitoring began in 2011; the lowest recorded reading was in 2022. There have been local concerns about the cause of frequent low water.

**Minard Lake.** In 2023, Minard Lake dropped 0.66 feet from spring highs to late summer lows. Water levels were similar to previous years with no noteworthy trend.

**East Twin Lake.** No data was collected at East Twin Lake in 2023.

# Lake George

# Coopers Lake

# Minard Lake

# 2023 Aquatic Invasive Vegetation Mapping

**Partners:** Lake George LID, Lake George Conservation Club, MNDNR, ACD

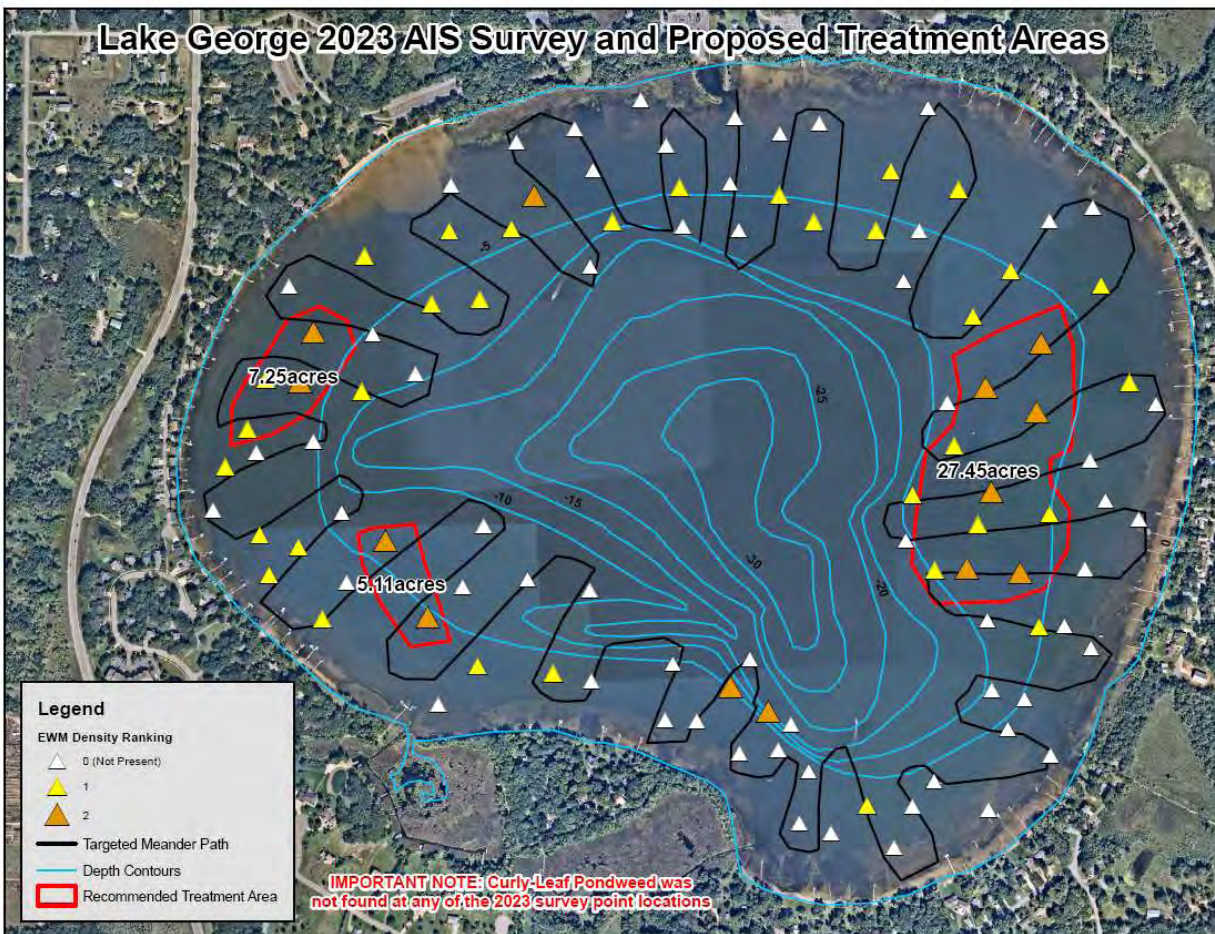

**Description:** ACD was contracted by the Lake George Lake Improvement District (GLID) to conduct an aquatic invasive vegetation delineation.

**Purpose:** To map out the presence of Curly Leaf Pondweed (CPL) and Eurasian Water Milfoil (EWM) as required for MN DNR herbicide treatment permits. The goal was to map these invasive species early in the growing season to allow for herbicide treatment as early as possible for reduced impacts on native plants and lessened possible impacts on water quality.

**Locations:** Lake George, City of Oak Grove

**Results:** The maps below were delivered to the MN DNR and Lake George Improvement District within 48 hours of the field surveys. These survey points were reviewed by the MN DNR and helped direct herbicide treatment efforts.

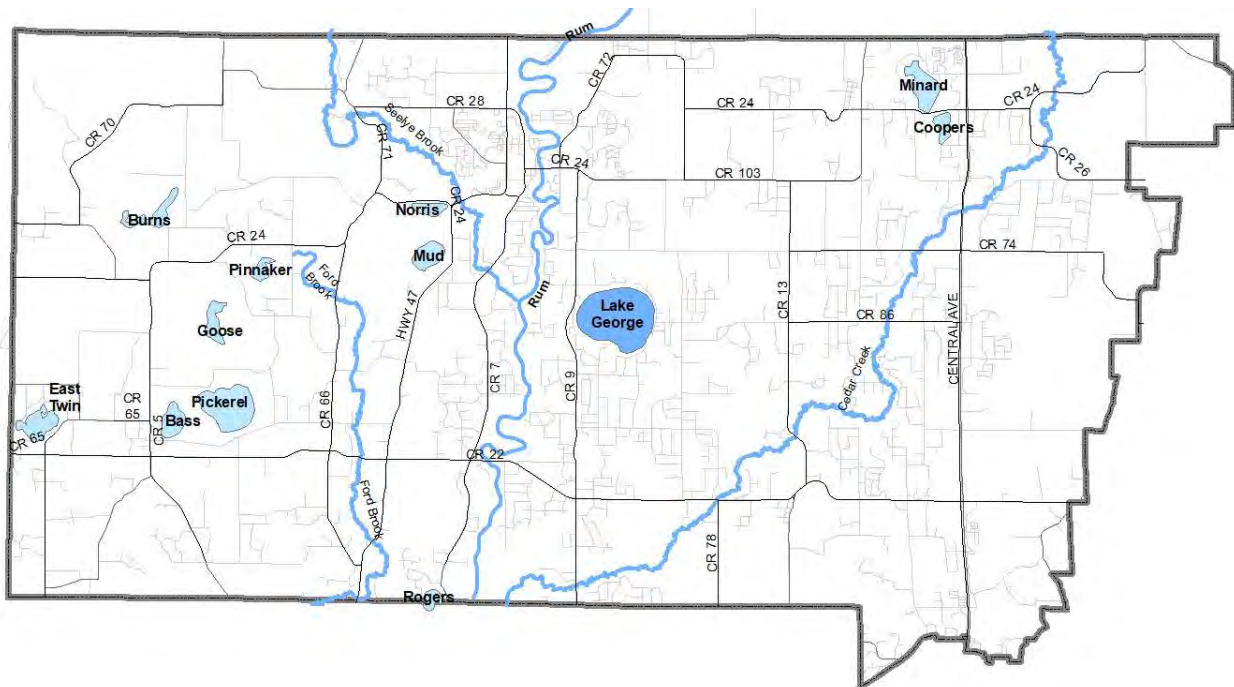

## Lake George CPL and EWM Survey - May 17, 2023

# Lake Water Quality

- Partners:** ACD, Lake George LID and Conservation Club, URRWMO
- Description:** Lake water quality monitoring was conducted ten times between May through September, approximately every two weeks. The monitoring parameters include total phosphorus, chlorophyll-a, Secchi transparency, dissolved oxygen, turbidity, temperature, specific conductance, pH, and salinity.
- Purpose:** To detect water quality trends and diagnose the cause of change.
- Locations:** Lake George
- Results:** Detailed data for each lake are provided on the following pages, including summaries of historical conditions and trend analysis. Previous years' data are available on the Minnesota Pollution Control Agency (MPCA) electronic data access (EDA) website or from ACD. Refer to Chapter 1 for additional information on lake dynamics and interpreting the data.

## 2023 Upper Rum River Watershed Lake Water Quality Monitoring Sites

# *Lake George*

*CITY OF OAK GROVE, LAKE ID # 02-0091*

## **Background**

Lake George is located in north-central Anoka County. The lake has a surface area of 535 acres with a maximum depth of 32 feet. Public access is from Lake George County Park on the lake's north side, where there is both a swimming beach and a boat launch. About 70% of the lake is surrounded by homes; the remainder is county parkland. The watershed is mostly undeveloped or vacant, with some residential areas, particularly on the lakeshore and in the southern half of the watershed. Lake George is a highly valued lake due to its recreational opportunities and ecological quality. The lake has a notably diverse plant community (most metro area lakes have 10-12 different aquatic plant species; Lake George is home to 24).

## **2023 Results**

In 2023, Lake George had good water quality with an "A" letter grade. Total phosphorous (TP) averaged 19.30 µg/L, which was similar to levels recorded in previous years except 2022. Chlorophyll-a (Cl-a) averaged 7.36 µg/L, which was similar to levels recorded in previous years except 2022.

2023 water quality was better than 2022, particularly for total phosphorus. In 2022, four samples had phosphorus concentrations over 40 µg/L, which was unusual and resulted in the highest observed average phosphorus on record. That year (2022), sampling was by the Metropolitan Council for the first time since 2009. In 2023, phosphorus concentrations were similar to those observed in other recent years. The reason for higher measured phosphorus in 2022 is unknown.

Secchi transparency, in general, was better in the beginning of the season and gradually became poorer into August and September. Average Secchi transparency was 8.66 ft. (2.6 m), which is a 1.5 ft. improvement from 2022. This value is mostly consistent with what was recorded between 2018 to 2021, however, it still indicates an overall declining trend in transparency.

Although Lake George water quality remains better than state standards and is ranked good for a metro county lake, simply adhering to these standards is not the goal for such an important water body. Decline of Lake George's Secchi transparency has been a cause for concern in recent years with a now twenty-two-year trend of decline in our statistical analyses.

## Trend Analysis

The Metropolitan Council (between 1980 and 2009) and ACD (1997, 1999, 2000, 2002, 2005, 2008, 2011, and 2013-2023) have collected over thirty-two years of water quality data. A broad analysis that simultaneously considers TP, Cl-a, and Secchi transparency did find a statistically significant trend of changing water quality between from 1980 to 2023 (repeated measures MANOVA with response variables TP, Cl-a, and Secchi transparency,  $p < 0.01$ ). When parameters are isolated for individual analysis, there is no significant change in Cl-a or TP. However, during this same period there is a statistically significant trend of declining Secchi transparency ( $p < 0.001$ ).

**Lake George Secchi Transparency Trend:** Includes years with partial datasets not covering all open water months. Those years are excluded from ACD's statistical analysis and graphs later in this document.

## Discussion

Lake George remains one of the clearest lakes in Anoka County, but a trend of declining Secchi transparency from the mid-1990s through around 2016 caused concern. In 2018, an intensive study of the lake and its watershed was completed. Work for the study included monitoring of tributaries, modeling, and evaluation of projects to correct declining water quality. The Lake George Improvement District, Lake George Conservation Club, Anoka Conservation District, and a state Clean Water grant funded the study.

The aforementioned study provides some insight into the causes of transparency decline. While a number of factors may play a role, an increase in the average amount of precipitation is the most significant driver identified. Water years (Oct. 1 – Sept. 30) that are wetter than the 100-year 90th percentile result in increased volumes of runoff and nutrients into the lake from surrounding tributaries, and the lake has the poorer clarity in those years, or in immediately subsequent years. These “wet” years were more frequent during the period when lake transparency declined. Six out of sixteen years from 2001 to 2017 were “wet” with water year precipitation above the historical 90th percentile, with 1999 reaching just under the 90th percentile mark. Additionally, four of these six wet years occurred during the sustained low Secchi transparency period of 2010 through 2017.

Annual variation in the relationship between Secchi transparency and precipitation indicates that precipitation is a major, but not the only, influence on water quality. The 2019 calendar year was the wettest on record, with Secchi results being only slightly poorer than in 2018, but that average was likely skewed by much higher readings earlier in the season. Annual precipitation in 2020-2023 was below average and the correlation between precipitation and Secchi clarity was again observed in 2020 and 2021 but not in 2022 which had low precipitation and poor Secchi transparency. In 2023, Secchi results returned to typical values that are expected with low precipitation. There is concern that climate change and increased runoff from development in the watershed will drive poorer water quality in Lake George into the future.

The Ditch 19 weir just east of Lake George was replaced in 2020. This structure is an important hydrological control for the lake and this project may have offered some additional clarity benefit right away. The replaced outlet structure should result in reduced nutrient delivery to the lake during wet years, and the broader benefits of restoring lake hydrology and enhancing game fish spawning opportunities.

Other actions identified in the 2018 study include agricultural best practices, an iron-enhanced sand filter in the County Park, public education, lakeshore restorations, enhanced stormwater standards for new developments in the lakeshed and others. While certain tributary subwatersheds do generate more nutrients than others, and therefore deserve special consideration for projects, it is also noted that some of these subwatersheds drain through large wetlands with some apparent pollutant removal ability. Projects nearest the lake are favored because they treat a larger upstream area and do not duplicate treatment that might already be provided by certain wetlands.

The MN DNR notes an additional concern for Lake George in the 2017 Rum River Watershed Fish-Based Lake IBI Stressor Identification Report. That report found Lake George’s fish community was not impaired, but was one of special concern and deemed vulnerable. Lack of aquatic habitat and near-shore development disturbances were indicated as stressors. To help address this concern, ACD received a grant to implement lakeshore restoration projects on the lake in 2021-2022. Additional lakeshore restoration projects were completed in 2023. These types of practices promote native lakeshore habitat while also reducing phosphorus loading into the lake.

# Stream Water Quality Monitoring

**Partners:** ACD, LRRWMO, and URRWMO

**Locations:** Rum River at C.R. 24, Seelye Brook at C.R. 7, Cedar Creek at C.R. 9, Rum River at C.R. 7, and Ford Brook at C.R. 63.

**Description:** Water quality monitoring was conducted four times between May – September, two times following storm events and two times during baseflow conditions. The monitoring parameters includes total phosphorus, total suspended solids, dissolved oxygen, turbidity, temperature, specific conductance, transparency, pH, and salinity.

## 2023 Rum River & Tributaries Monitoring Sites

# *Rum River & Tributaries Water Quality*

Rum River at Co. Rd. 24 (Bridge St), St. Francis	STORET Site ID = S000-066
Seelye Brook at Co. Rd. 7, St. Francis	STORET Site ID = S003-204
Cedar Creek at Hwy 9, Oak Grove	STORET Site ID = S003-203
Rum River at Co. Rd. 7 (Roanoke St), Ramsey	STORET Site ID = S004-026
Ford Brook at Co. Rd 63, Ramsey	STORET Site ID = S003-200

---

## **Background**

The Rum River is one of Anoka County’s most valued water resources. The river is designated as a state “scenic and recreational” river until it reaches southern Anoka County and is used extensively for all types of recreation. A large portion of western Anoka County drains to the Rum River including the subwatersheds of Seelye Brook, Trott Brook, Ford Brook, and Cedar Creek.

The Rum River and tributaries have been monitored simultaneously in multiple years (2004, 2009-2011, 2014-2019, 2022, & 2023). The objective of this data is to help determine how water quality changes in the Rum River system as it moves through Anoka County and where these changes might be occurring. The data is reported for all sites, side-by-side, for a more comprehensive analysis of water quality in the Rum River, upstream to downstream. Land use surrounding the river changes dramatically from rural residential in the upstream portions of Anoka County to suburban and urbanized in the downstream areas. Sites included:

**Rum River at C.R. 24** is located in northern Anoka County, within the City of St. Francis where the Isanti County border is just upstream. This location is the best available site to monitor the upstream extent of the Upper Rum River Watershed Management Organization and Anoka County.

**Cedar Creek at C.R. 9** is a tributary originating in southcentral Isanti County, flowing southwest before entering the Rum River. Cedar Creek flows through northcentral Anoka County, progressing through lands with high-quality natural communities, including the Cedar Creek Ecosystem Science Reserve. Habitat in the lower stretches of the stream are of moderate quality with little development, but the stream is listed as an impaired water for excessive *E. coli* bacteria. Cedar Creek is one of the larger streams in Anoka County, reaching 25-feet wide and regularly having depths greater than 2-feet during baseflow conditions. The stream bottom is primarily silt. The watershed is moderately developed with scattered single-family homes but the area continues to develop rapidly.

**Seelye Brook at Hwy 7** is a tributary originating in southwestern Isanti County, flowing south through northwestern Anoka County before entering the Rum River. This stream is low gradient, like most other local streams. Seelye Brook has a silty or sandy bottom and lacks riffle-pool sequences. It is a moderate to large stream for Anoka County, with a typical baseflow width of 20-25 feet.

**Rum River at Hwy 7** is an approximate mid-way point for the Rum River in Anoka County. It is at the approximately dividing line of the Upper and Lower Watershed Management Organizations.

**Ford Brook at C.R. 63** is a tributary originating from a chain of lakes in northwestern Anoka County – Goose, Pinaker, and Eckstrom. The stream flows south until merging with Trott Brook just before entering the Rum River. The stream was identified in the local watershed plans as priority waterbody due to elevated nutrient loads that ultimately deliver to the Rum River.

**Rum River at Anoka Dam** represents the downstream extent of the Rum River in Anoka County before it enters the Mississippi River. While the Rum River technically extends farther downstream, monitoring occurs at this location to avoid backwater influences of the Mississippi River. This site is monitored by the Metropolitan Council (Met Council), and annual monitoring has occurred back to 1996.

### **Results Summary**

This report includes data from 2023 and an overview of historical data. All sites were monitored by ACD staff, except for the Rum River at the Anoka Dam site which was monitored by the Metropolitan Council following a different schedule and sampling protocol. Metropolitan Council data is still included in this report for comparison purposes.

The following is a summary of results:

- Dissolved constituents were measured by specific conductivity and chlorides. Specific conductivity in the Rum River is lower than other Anoka County streams and within the healthy range. Chlorides are a regional concern and proactive measures to ensure it does not become elevated in the Rum River watershed is recommended. Periodic monitoring every 2-5 years is recommended.
- pH was within a healthy range (6.5-8.5) at all monitoring sites in in 2023 except for two occasions. These two samples were recorded above the state standard, but they are atypical values and are suspected to be the result of a faulty pH sensor.
- Dissolved oxygen remained above the state standard of 5 mg/L except for one occasion at Ford Brook at C.R. 63.
- Phosphorus levels in the Rum River in recent years have regularly exceeded the state standard of 100 µg/L at all sampled sites, but on average have been slightly lower than this threshold. In 2023, total phosphorus in the Rum River averaged 67 µg/L (C.R. 24) and 70.75 µg/L (C.R. 7) at sampled sites from upstream to downstream. Reducing phosphorus levels in the Rum River is a regional priority.
- Suspended solids and turbidity remained at acceptable levels in the Rum River, Cedar Creek, Seelye Brook, and Ford Brook. Robust stormwater treatment within new developments and continued surveillance monitoring is recommended.
- Overall – The priority for the Rum River is reducing phosphorus. A 5% reduction is a top goal identified in local and regional plans. Achieving it will require work throughout the watershed, including upstream of Anoka County.

This report only includes parameters that were tested in 2023 and does not include any additional parameters tested by the Met Council or any of their additional sampling. For more detailed information, see Met Council reports at <https://eims.metc.state.mn.us/>. All raw data can be obtained from ACD's online database (<https://maps.barr.com/Anoka/Home/Chart/>), and is also available through the MPCA's EQuIS database, (<https://www.pca.state.mn.us/data/environmental-qualityinformation-system-equis>). The data is presented and discussed for each parameter in greater detail below. Management recommendations for each parameter is included in individual sections.

## Specific Conductivity and Chlorides

Dissolved pollutant sources include urban road runoff, salt, and agricultural or industrial chemicals, among many others. Conductivity is a broad measure of dissolved pollutants. High conductivity often triggers additional work to determine the cause. Chlorides measures certain salts, such as those used for road deicing or in water softeners, that are frequent causes of high conductivity. The State deems a stream or river “impaired” when chloride measurements regularly exceed 230 mg/L.

Specific conductivity was acceptably low in the Rum River in 2023. Specific conductivity at the Rum River sites was similar, and in nearly all years it increases slightly upstream to downstream. Average specific conductivity from upstream to downstream in 2023 (all conditions) was 0.353 mS/cm (C.R. 24), 0.388 mS/cm (C.R. 7), and 0.394 mS/cm (Anoka Dam), respectively. This consistent trend of increasing conductivity from upstream to downstream likely reflects higher road densities and greater deicing efforts with salt application, as well as other pollutant sources associated with higher road density and development.

In 2023, specific conductivity in the Rum River was higher during baseflow conditions than during stormflows. This is a consistent trend in previous years, and it provides some insight into the pollutant sources. If dissolved pollutants were only elevated after storms, stormwater runoff would be suspected as the primary driver. However, because dissolved pollutants are highest during baseflow conditions, the suspected primary contributor is pollution of the shallow groundwater, which normally feeds the river during baseflow. The largest source of pollution is believed to be road salts that have infiltrated into the shallow aquifer. Water softening salts and geologic materials can also be pollution contributors.

Specific conductivity in the tributary streams – Seelye Brook, Ford Brook, and Cedar Creek – was mostly higher during stormflow conditions, but average values of baseflow and stormflow conditions were similar. Average specific conductivity in 2023 (all conditions) was 0.545 mS/cm (Seelye Brook at C.R. 7), 0.609 mS/cm (Ford Brook at C.R. 63), and 0.433 mS/cm (Cedar Creek at C.R. 9). These values are higher than the average conductivity reported in the main stem of the Rum River.

In 2023, chlorides were monitored in the Rum River at C.R. 7 (on 4 of 8 sampling occasions) and in the Rum River at the Anoka Dam. Chloride results ranged from 17.3 mg/L to 29.7 mg/L, far below the state’s chronic standard for aquatic life (230 mg/L). Sampling did not occur during snowmelt, when chloride is likely to be at its highest.

For water resource management, it is important to note that the sources of dissolved pollutants are generally the same for both stormwater and baseflow it is only the timing of delivery to the waterway that is different. Preventing the release of dissolved pollutants into the environment and treating them before infiltration occurs should be a high priority. Training and equipment that minimize road salting while still maintaining safe roads safe is being increasingly emphasized by watershed managers. The MPCA now provides a training program where organizations and employees to obtain a smart-salting certification, which then has to be renewed every few years.

**Specific Conductivity during Baseflow and Storm Conditions.** Box plots show the median (middle line), 25<sup>th</sup> and 75<sup>th</sup> percentile (ends of box), and 10<sup>th</sup> and 90<sup>th</sup> percentiles (floating outer lines). Historical boxplot data also includes this year's data.

**Chlorides during Baseflow and Storm Conditions.** Box plots show the median (middle line), 25<sup>th</sup> and 75<sup>th</sup> percentile (ends of box), and 10<sup>th</sup> and 90<sup>th</sup> percentiles (floating outer lines). Historical boxplot data also includes this year's data.

## pH

pH refers to the acidity of the water. The state standard range for pH is between 6.5 - 8.5, and pH is generally lower during storm events than during baseflow conditions because the pH of rain is typically lower (more acidic). While acid rain is a longstanding problem, its effect on this aquatic system is minimal. The rare occasions when pH is below or exceeds the state standard should not be concerning. No sampling occasions were below or exceeded the state standard range during 2023 at any of the monitoring sites.

**Rum River.** In 2023, the average pH in the Rum River was 7.93 during baseflow conditions and 7.78 post-storm. Historically, the Rum River exceeded the state standard on eleven occasions, and has been below the state standard on only two occasions.

**Cedar Creek.** In 2023, the average pH in Cedar Creek was 7.72 during baseflow conditions and 7.65 post-storm. Historically, Cedar Creek has exceeded the state standard on five occasions.

**Seelye Brook.** In 2023, the average pH in Seelye Brook was 7.85 during baseflow conditions and 7.41 post-storm. Historically, Seelye Brook has exceeded the state standard on five occasions.

**Ford Brook.** In 2023, the average pH in Ford Brook was 7.59 during baseflow conditions and 7.54 post-storm. Historically, Ford Brook has exceeded the state standard on three sampling occasions, and has been below the state standard on only two occasions.

## Dissolved Oxygen

Dissolved oxygen is necessary for aquatic life to survive and thrive. Organic pollution causes oxygen to be consumed during decomposition. If oxygen levels in water fall below 5 mg/L, aquatic life begins to suffer. A stream is considered impaired if 10% of observations are below 5 mg/L in the last 10-years. Dissolved oxygen levels are typically lowest in the early morning because of decomposition consuming oxygen at night without the offsetting of oxygen production by photosynthesis.

**Rum River.** In 2023, all measurements of dissolved oxygen in the Rum River were above 5 mg/L. Dissolved oxygen has never been observed below this state standard at any of the Rum River sites. Only on a handful of occasions has dissolved oxygen been recorded below 6.0 mg/L and many of these results were recorded during the same storm event. In 2023, the lowest observation was 6.0 mg/L during baseflow conditions.

**Cedar Creek.** In 2023, all measurements of dissolved oxygen in Cedar Creek were above 5 mg/L. The lowest observation this year was 6.0 mg/L post-storm. Historically, dissolved oxygen has been observed below the state standard in Cedar Creek on five different occasions, the majority of which were observed post-storm.

**Seelye Brook.** In 2023, all measurements of dissolved oxygen in Seelye Brook were above 5 mg/L. The lowest observation this year was 6.78 mg/L post-storm. Historically, dissolved oxygen has been observed below the state standard in Seelye Brook on four different occasions, equally distributed between baseflow conditions and post-storm conditions.

**Ford Brook.** In 2023, one measurement of dissolved oxygen in Ford Brook fell below the state of 5 mg/L. This measurement was recorded at 4.56 mg/L during baseflow conditions. Historically, dissolved oxygen has been observed below the state standard in Seelye Brook on two different occasions (including 2023), equally distributed between baseflow conditions and post-storm conditions.

Only a few observations of dissolved oxygen below 5 mg/L have been observed in all years at the above sites. As such, there is no management concern at this time. A common driver of lower oxygen is higher nutrients, so nutrient reduction efforts will have a secondary benefit of preventing low oxygen.

## Total Phosphorus

The nutrient phosphorus (TP) is one of the most common pollutants to local waterways, and can be associated with stormwater runoff, wastewater, fertilizers, soil loss, and many other sources. Since it is an essential nutrient in the natural ecosystem, even a slight increase of phosphorus levels in a waterway can result in harmful algae blooms, accelerated plant growth, low dissolved oxygen levels and other negative effects to fish, macroinvertebrates, and other aquatic animals. Phosphorus reduction is a management priority in the Rum River watershed. Local and regional plans have set a 5% reduction to ensure the river does not become classified as “impaired” by the State.

The State deems a stream or river “impaired” in the central region of Minnesota when TP measurements exceed 100 µg/L and a second condition is met. The second condition is chlorophyll-a >18 µg/L, diel dissolved oxygen flux of 3.5 mg/L or periphyton chlorophyll-a >150 mg/m<sup>2</sup>.

**Rum River.** In 2023, average phosphorous concentrations at the Rum River sites (all conditions), upstream to downstream, were 67.0 µg/L (C.R. 24), 67.4 µg/L (C.R. 7), and 69.9 (Anoka Dam), respectively. On average, phosphorous was higher during baseflow than during stormflow, which is atypical. For example, the average TP across all years at the Rum River C.R. 7 site is 87.2 µg/L during baseflow and 104.5 µg/L post-storm. Historically, 58 of the 162 measurements taken at these Rum River sites have been greater than 100 µg/L.

**Cedar Creek.** In 2023, TP levels in Cedar Creek averaged 129.0 µg/L during all conditions. It averaged 123.0 µg/L during baseflow and 135.0 µg/L post-storm. Historically, 41 of the 61 measurements taken at the Cedar Creek site have been greater than 100 µg/L. Individual results over 200 µg/L have been a near-annual occurrence since 2015, but were not observed in 2022 and 2023.

**Seelye Brook.** In 2023, TP levels in Seelye Brook averaged 128.8 µg/L during all conditions. It averaged 133.5 µg/L during baseflow and 124.0 µg/L post-storm. Historically, 44 of the 53 measurements taken at the Seelye Brook site have been greater than 100 µg/L.

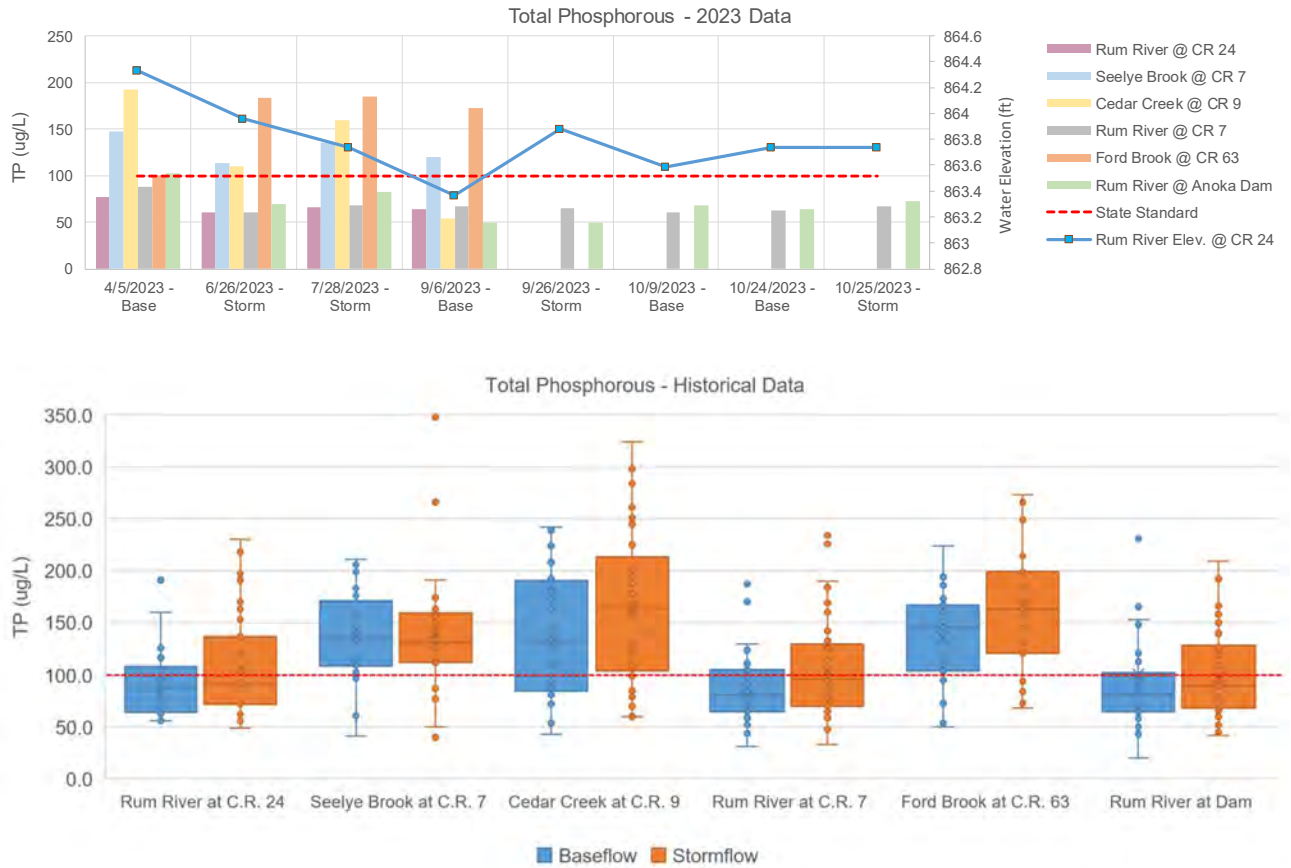

**Ford Brook.** In 2023, TP levels in Ford Brook averaged 160.5 µg/L during all conditions. It averaged 136.50 µg/L during baseflow and 184.50 µg/L post-storm. Historically, 49 of the 60 measurements taken at the Ford Brook site have been greater than 100 µg/L.

## ***Turbidity and Total Suspended Solids***

Turbidity and total suspended solids (TSS) are two measurements of solid material suspended in the water. Turbidity is measured by refraction of a light beam passed through a water sample and is sensitive to larger particles. TSS is measured by filtering solids from a water sample and weighing the filtered material. The amount of suspended material present in water is important because it affects water transparency, aquatic life, and because many other pollutants are attached to sediment particles. Suspended solids in the waterway can come from both internal and external sources. External sources can include a variety of particles in stormwater runoff. Internally, bank erosion and movement of the bottom substrate contribute to suspended sediments. A moderate amount of this type of internal loading is natural. The State deems a stream or river “impaired” in the central region of Minnesota when 10% of TSS measurements exceed 30 mg/L. There is no turbidity standard.

**Rum River.** In 2023, average turbidity at the Rum River sites for all conditions, upstream to downstream, was 9.1 NTU (C.R. 24), 5.6 NTU (C.R. 7), and 2.3 NTU (Anoka Dam), respectively. The average TSS at the Rum River sites for all conditions, upstream to downstream, was 6.0 mg/L (C.R. 24), 5.5 mg/L (C.R. 7), and 3.9 mg/L (Anoka Dam), respectively. Turbidity is generally low in the Rum River but increases are observed after storm events. There is no clear trend of changing turbidity or suspended solids from upstream to downstream.

**Cedar Creek.** In 2023, average turbidity in Cedar Creek was 10.5 NTU during baseflow conditions and 15.5 post-storm. Average TSS in Cedar Creek was 17.0 mg/L during baseflow conditions and 19.0 mg/L post-storm. The historical median TSS in Cedar Creek has been 13.0 mg/L during baseflow conditions and 14.0 mg/L post-storm. While TSS in Cedar Creek is above the historical median for Anoka County streams, it remains well below the state standard (30 mg/L). Historically, TSS has been observed above the state standard in Cedar Creek on seven different occasions, the majority of which were post-storm. Reasons for low suspended material likely include the relative lack of manmade stormwater outfalls and the fact that the creek slowly meanders through broad floodplain wetlands.

**Seelye Brook.** In 2023, average turbidity in Seelye Brook was 5.7 NTU during baseflow conditions and 0.7 NTU post-storm. Average TSS in Seelye Brook was 8.5 mg/L during baseflow conditions and 4.5 mg/L post-storm. The historical median TSS in Seelye Brook has been 5.5 mg/L during baseflow conditions and 6.0 mg/L post-storm. These are healthy levels that are well below the state standard. Only on one occasion was TSS recorded above the state standard in Seelye Brook.

**Ford Brook.** In 2023, average turbidity in Ford Brook was 12.8 NTU during baseflow conditions and 7.8 NTU post-storm. Average TSS in Ford Brook was 14.0 mg/L during baseflow conditions and 7.5 mg/L post-storm. The historical median TSS in Ford Brook has been 6.0 mg/L during baseflow conditions and 14.0 mg/L post-storm. Historically, TSS has been observed above the state standard in Ford Brook on seven different occasions, the majority of which were post-storm.

Rum River @ CR 7	6.9	6.0	46	0
Ford Brook @ CR 63	11.3	9.0	29	2
Rum River @ Anoka Dam	8.4	5.5	46	3

TSS - Historical Stormflow Data

	AVG	MED	TOTAL #	> 30 mg/L
Rum River @ CR 24	9.5	7.0	35	0
Seelye Brook @ CR 7	6.9	6.0	25	0
Cedar Creek @ CR 9	18.3	14.0	29	5
Rum River @ CR 7	9.4	8.0	48	0
Ford Brook @ CR 63	17.3	14.0	31	5
Rum River @ Anoka Dam	8.8	6.0	40	1

While the Rum River and these tributaries remain well under the impairment threshold for TSS, rigorous stormwater treatment in new developments should be a priority in the coming years. There are also opportunities to better treat current runoff from developed and agricultural landscapes. ACD and partners currently have a well-funded riverbank stabilizations program because it offers multiple benefits to water quality, habitat, and protecting property.

**Turbidity during Baseflow and Storm Conditions.** Box plots show the median (middle line), 25<sup>th</sup> and 75<sup>th</sup> percentile (ends of box), and 10<sup>th</sup> and 90<sup>th</sup> percentiles (floating outer lines). Historical boxplot data also includes this year's data.

**Total Suspended Solids during Baseflow and Storm Conditions.** Box plots show the median (middle line), 25<sup>th</sup> and 75<sup>th</sup> percentile (ends of box), and 10<sup>th</sup> and 90<sup>th</sup> percentiles (floating outer lines). Historical boxplot data also includes this year's data.

# *Stream Water Quality – Biological Monitoring*

**Partners:** St. Francis American Legion Post #622, St. Francis High School, ACD, URRWMO

**Description:** This long-standing district program combines environmental education and stream water quality monitoring. Under the supervision of ACD staff, high school science classes collect aquatic macroinvertebrates from stream sites, identify their catch to the family level, and then use the biotic index to score water and habitat quality. Different families of macroinvertebrates have different water and habitat quality requirements. The families collectively known as EPT (Ephemeroptera, or mayflies Plecoptera, or stoneflies and Trichoptera, or caddisflies) are generally pollution intolerant. Other families can thrive in low-quality water. Therefore, a census of stream macroinvertebrates yields important information on overall stream health.

**Purpose:** To assess stream quality through biological monitoring while providing an environmental education service to the community.

**Location:** Rum River at Rum River North County Park, St. Francis

**Results:** Results for each site are detailed on the following pages.

## **Data Interpretation**

Consider all biological indices of water quality together rather than look at each alone, since each gives only a partial picture of stream condition. Compare the final numbers to county-wide averages. This gives some sense of what might be expected for streams in a similar landscape, but does not necessarily reflect what might be expected of a minimally impacted stream. Some key numbers to look for include:

# Families Number of Invertebrate families. Higher values indicate better quality.

EPT Number of families of the generally pollution-intolerant orders. Ephemeroptera, Plecopter, Trichoptera. Higher numbers indicate better stream quality.

Family Biotic Index (FBI) An Index that utilizes known pollution tolerances for each family. Lower numbers indicate better stream quality.

<b>FBI</b>	<b>Stream Quality Evaluation</b>
0.00-3.75	Excellent
3.76-4.25	Very Good
4.26-5.00	Good
5.01-5.75	Fair
5.76-6.50	Fairly Poor
6.51-7.25	Poor
7.26-10.00	Very Poor

Population Attributes Metrics **% EPT** compares the number of organisms in the EPT orders (Ephemeroptera, Plecoptera, Trichoptera) to the total number of organisms in the sample. A high percent of EPT is good.

**% Dominant Family** measures the percentage of individuals in the sample that are in the sample's most abundant family. A high percentage is usually bad because it indicates low evenness (one of a few families dominate, and all others are rare)

# Rum River

St. Francis High School, St. Francis

## Monitored Since

2000

## Student Involvement

Approx. 150 students in 2023, approximately 1,800 since 2000. The site is monitored by St. Francis High School, with facilitation by the Anoka Conservation District.

## Background

The Rum River originates from Lake Mille Lacs, and flows south through western Anoka County where it joins the Mississippi River in the City of Anoka. Other than the Mississippi, the Rum River is the largest river in the county. In Anoka County, the river has both rocky riffles as well as pools and runs with sandy bottoms. The river's condition is generally regarded as excellent. Large portions of the Rum River in Anoka County have a State "scenic and recreational river" designation.

The sampling site is in Rum River North County Park, in St. Francis. This site is typical of the Rum in Northern Anoka County, having a rocky bottom with numerous pool and riffle areas.

## Results

All students who participated in 2023 sampling were part of sophomore biology courses. All specimens were identified to the best of the students' abilities for a rapid assessment in the field and then returned to the river. As a result, no preserved samples are available for ACD identification and inclusion in the Water Almanac.

**Summarized Biomonitoring Results for Rum River North County Park, St. Francis**  
(samplings by St. Francis High School and Crossroads Schools in 2002-2003 are averaged)

**Biomonitoring Data for Rum River at Rum River North County Park, St. Francis**

Data presented are from the most recent five years. Complete data from 2021 is not available, as the number of individuals of each species collected were not recorded. The categories that rely on this information are left blank for 2021. Additionally, 2023 has been excluded as no preserved samples are available for ACD identification.

Year	2013	2014	2015	2019	2021	Mean
Season	Spring	Fall	Fall	Spring	Spring	2000-2021
FBI	3.8	8.4	6.3	5.1	4.2	5.0
# Families	18	9	8	16	13	19.8
EPT	11	4	0	9	8	9.5
Date	20-May	24-Oct	22-Jul	19-May	26-May

Sampling Method	MH	MH	MH	MH	MH	
Mean # Individuals/Rep.	247.5	219	23	139		
# Replicates	2	1	1	1		
Dominant Family	Baetiscida	Corixidae	Cambaridae	Siphonuridae		
% Dominant Family	34.7	86.3	34.8	32.4		
% Ephemeroptera	54.1	3.7	0	46		
% Trichoptera	6.3	0.5	0.0	0		
% Plecoptera	30.3	2.3	0	18		

**Discussion**

Historically, both chemical and biological monitoring indicate the good water quality of this river. Poorer results in 2014 and 2015 may reflect varying site and sampling conditions rather than a shift in the biological community. Habitat is ideal for a variety of stream life, and includes a variety of substrates, plenty of woody snags, riffles, and pools. Taxa that are extremely sensitive to pollution are still being found. Water chemistry monitoring done at various locations on the Rum River throughout Anoka County indicates that water quality is also good. Continued biological monitoring is recommended both as an education program and for long-term ecological condition monitoring.

# Wetland Hydrology

**Partners:** URRWMO, ACD

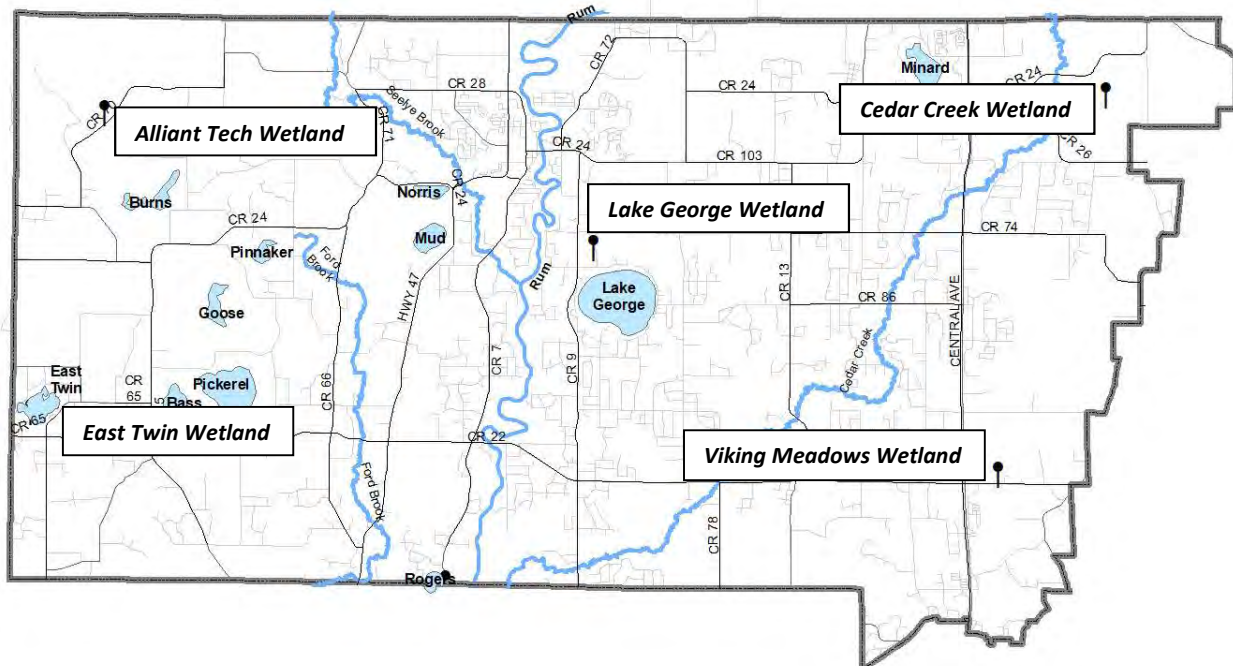

**Description:** Continuous groundwater level monitoring at a wetland boundary. Countywide, ACD maintains a network of 23 wetland hydrology monitoring stations.

**Locations:** Alliant Tech Wetland, East Twin Wetland, Lake George Wetland, Cedar Creek Wetland, Viking Meadows Wetland.

**Purpose:** To provide understanding of wetland hydrology, including the impacts of climate and land use change. These data aid in delineation of nearby wetlands by documenting hydrologic trends including the timing, frequency, and duration of saturation.

**Results:** See the following pages.

## 2023 URRWMO Wetland Hydrology Monitoring Site

# ALLIANT TECH REFERENCE WETLAND

Alliant Tech Systems Property, St. Francis

## Site Information

**Monitored Since:** 2001  
**Wetland Type:** 5  
**Wetland Size:** ~12 acres  
**Isolated Basin:** Yes  
**Connected to a Ditch:** No  
**Surrounding Soils:** Emmert

## Soils at Well Location:

Horizon	Depth	Color	Texture	Redox
A	0-8	N2/0	Murky loam	-
Bg	8-35	5y5/1	Sandy Loam	-

## Vegetation at Well Location:

Scientific	Common	% Coverage
Carex Spp	Sedge undiff.	90
Lycopus americanus	American Bungleweed	20
Phalaris arundinacea	Reed Canary Grass	5

**Other Notes:** This wetland lies next to the highway in a low area surrounded by hilly terrain. The boring is located near the wetland edge. The basin holds water throughout the year.

## 2023 Hydrograph (Well Depth 40 inches)

# CEDAR CREEK REFERENCE WETLAND

## Cedar Creek Ecosystem Science Reserve, East Bethel

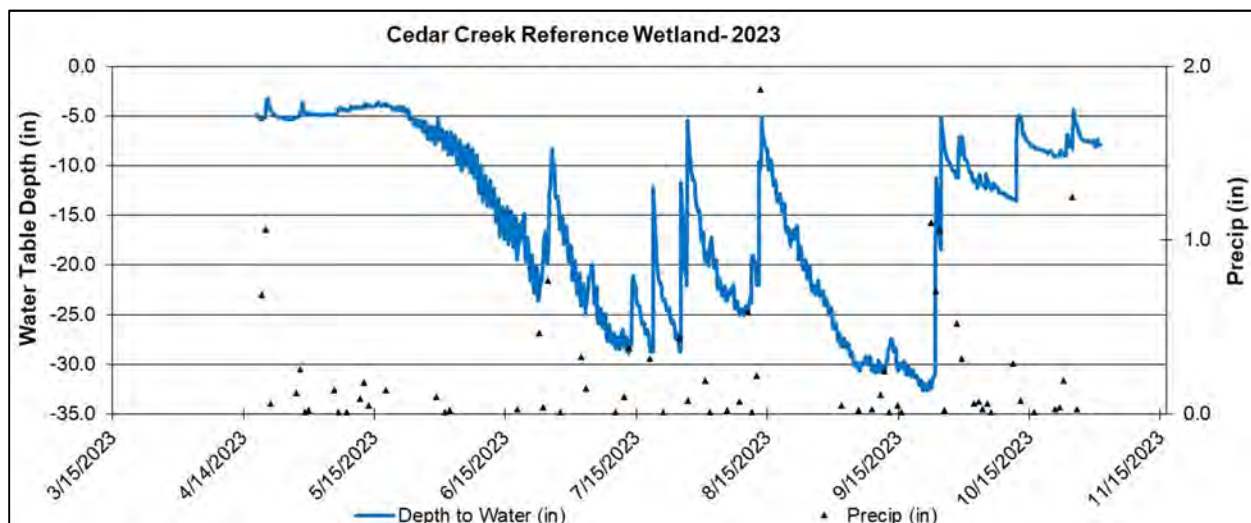

### Site Information

<b>Monitored Since:</b>	1996
<b>Wetland Type:</b>	6
<b>Wetland Size:</b>	>150 acres
<b>Isolated Basin:</b>	No
<b>Connected to a ditch:</b>	No
<b>Surrounding Soils:</b>	Zimmerman
<b>Soils at Well Location:</b>	Not yet available
<b>Vegetation at Well Location:</b>	Not yet available

**Other Notes:** This wetland is located within a science research reserve, operated by the University of Minnesota. Much of this area, including the area surrounding the monitoring site, is in a natural state. This wetland probably has some hydrologic connection to the floodplain of Cedar Creek.

### 2023 Hydrograph (Well Depth 40 inches)

# EAST TWIN REFERENCE WETLAND

Twin Lake City Park, Nowthen

## Site Information

**Monitored Since:** 2001  
**Wetland Type:** 5  
**Wetland Size:** ~5.9 acres  
**Isolated Basin:** Yes  
**Connected to a Ditch:** No  
**Surrounding Soils:** Lake Beach, Growton and Heyder fine sandy loam

## Soils at Well Location:

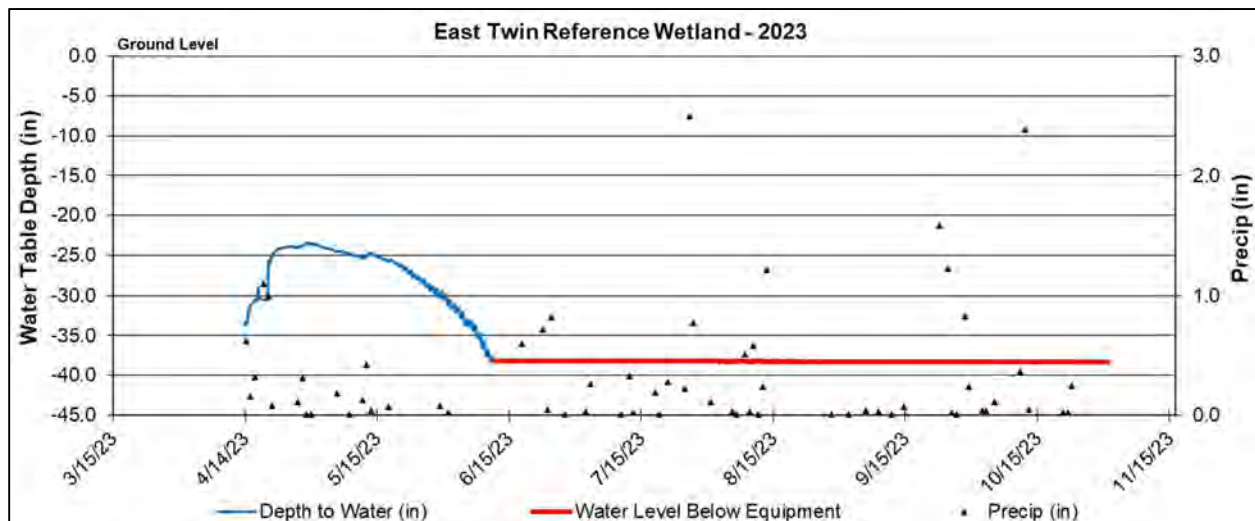

Horizon	Depth	Color	Texture	Redox
A	0-8	10yr 2/1	Mucky Loam	-
Oa	Aug-40	N2/0	Organic	-

## Vegetation at Well Location:

Scientific	Common	% Coverage
Phalaris arundinacea	Reed Canary Grass	100
Cornus amomum	Silky Dogwood	30
Fraxinus pennsylvanica	Green Ash	30

**Other Notes:** This wetland is located in Twin Lake Community Park near East Twin Lake and lake levels influence the hydrology of the wetland.

## 2023 Hydrograph (Well Depth 38 inches)

# LAKE GEORGE REFERENCE WETLAND

Lake George County Park, Oak Grove

## Site Information

**Monitored Since:** 1997  
**Wetland Type:** 3/4  
**Wetland Size:** ~9 acres  
**Isolated Basin:** Yes  
**Connected to a Ditch:** No  
**Surrounding Soils:** Lino loamy fine sand and Zimmerman fine sand

## Soils at Well Location:

Horizon	Depth	Color	Texture	Redox
A	0-8	10yr2/1	Sandy Loam	-
Bg	8-24	2.5y5/2	Sandy Loam	20% 10yr5/6
2Bg	24-35	10gy 6/1	Silty Clay Loam	10% 10yr 5/6

## Vegetation at Well Location:

Scientific	Common	% Coverage
Cornus stolonifera	Red-osier Dogwood	90
Populus tremuloides	Quaking Aspen	40
Quercus rubra	Red Oak	30
Onoclea sensibilis	Sensitive Fern	20
Phalaris arundinacea	Reed Canary Grass	10

**Other Notes:** This wetland is located in Lake George County Park near Lake George. Data unavailable between 6/12/2023 and 7/7/2023.

## 2023 Hydrograph (Well Depth 40 inches)

# VIKING MEADOWS REFERENCE WETLAND

Viking Meadows Gold Course, East Bethel

## Site Information

**Monitored Since:** 1999  
**Wetland Type:** 2  
**Wetland Size:** ~0.7 acres  
**Isolated Basin:** No  
**Connected to a Ditch:** Yes  
**Surrounding Soils:** Zimmerman fine sand

## Soils at Well Location:

Horizon	Depth	Color	Texture	Redox
A	0-12	10yr2/1	Sandy Loam	-
Ab	12-16	N2/0	Sandy Loam	-
Bg1	16-25	10yr4/1	Sandy Loam	-
Bg2	25-40	10yr4/2	Sandy Loam	5% 10yr5/6

## Vegetation at Well Locations:

Scientific	Common	% Coverage
Phalaris arundinacea	Reed Canary Grass	100
Acer rubrum (T)	Red Maple	75
Acer negundo (T)	Boxelder	20

**Other Notes:** This wetland is located at the entrance to Viking Meadows Golf Course, and is located near the wetland edge. The boring was dry in the fall season due to abnormally dry conditions throughout Anoka County.

## 2023 Hydrograph (Well Depth 44 inches)

# Water Quality Improvement Projects

The following water quality projects were installed in 2023 in the Upper Rum River WMO.

## Lake George Shoreline Stabilizations (2)

Shoreline stabilizations and native plant buffers were completed at two adjacent properties on Lake George. The shorelines, at 41 and 55 linear feet, were bare eroding sand and turf grass prior to the projects. The project included rock rip rap and native plant buffers of 370 and 287 square feet. Funding was from a Watershed Based Implementation Funding (WBIF) grant and landowners.

Photos: Site conditions before (left) and after (right).

## Rum River Blvd Swale Stabilization

A roadside swale stabilization was completed on the west side of the St. Francis High School campus. The project stabilized a 460 ft eroding swale. The project was a priority because the swale terminates in a stream that drains to the Rum River less than 500 ft downstream. The swale receives a large amount of runoff from the high school and adjacent lands. The 9.97 ac drainage is more than half impervious surface. Funding was from a Watershed Based Implementation Funding (WBIF) grant and the Upper Rum River Watershed Management Organization. Partners included the City of St. Francis, St. Francis High School, and Anoka Co Highway Department.

**Photos: Site conditions before (left) and after (right).**

### Dellwood Community Park Rum Riverbank Stabilization

Moderate to severe bank erosion along 630 feet of Rum Riverbank in Dellwood River Park (St. Francis) was causing significant tree and soil loss and was threatening a public walking trail. Several practices were used to stabilize the riverbank including three rock bendway weirs that deflect flow away from the bank, rock rip rap, root wads, and cedar tree revetments. Funding was from the Lessard-Sams Outdoor Heritage Fund City of St. Francis, and Anoka County.

**Photos: Site conditions before (left) and after (right).**

### Cedar Creek Conservation Area Rum Riverbank Stabilization

Anoka Conservation District (ACD) in partnership with the Conservation Corps of Minnesota & Iowa (CCMI) and Anoka County Parks installed a cedar tree revetment within the Cedar Creek Conservation Area in Oak Grove. Installation of this revetment has been ongoing from 2021-2023 and totals 2,305 linear feet. The cut cedar trees, anchored to the bank, provide soft armor to prevent erosion. Shrubs are planted by live staking for long term stabilization. Funding was from a MN DNR Conservation Partners Legacy grant, grant of crew time from the Conservation Corps of MN and IA, and donated materials

**Photos: Site conditions before (left) and after (right).**

**Septic System Fix Up**

One non-compliant septic system was replaced in 2023 using grant funds for low income households. The SSTS Fix-Up Program is administered by ACD, which prioritizes projects near priority lakes and streams. Funding was from a Watershed Based Implementation Funding (WBIF) grant and the landowner. The 2023 project was adjacent to Ford Brook.

# Subwatershed Studies

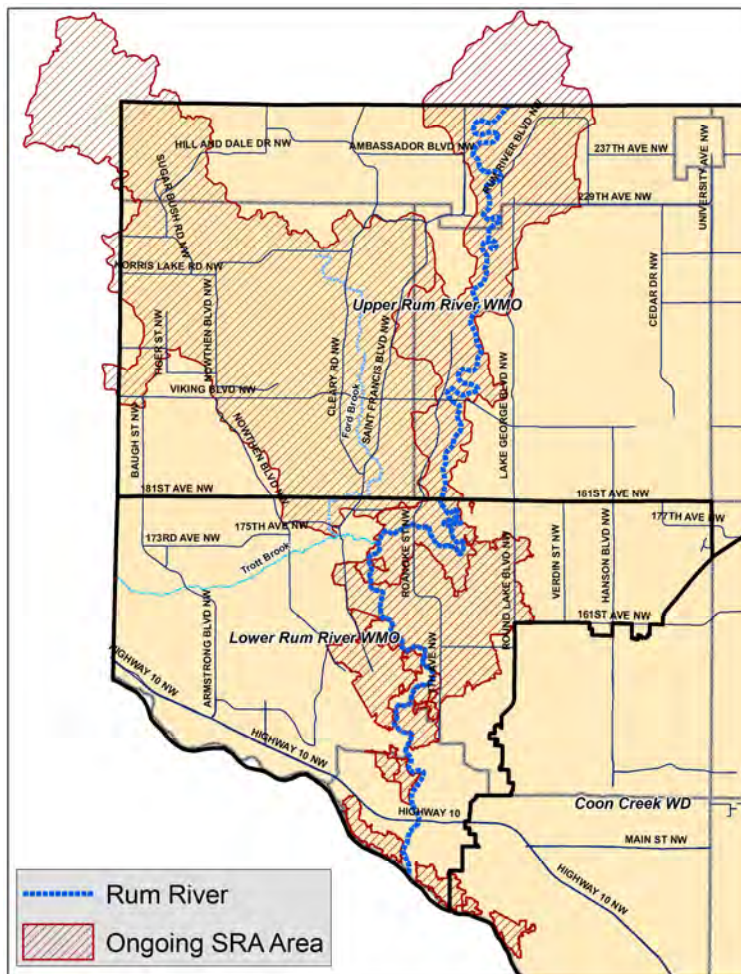

**Partners:** LRRWMO, URRWMO, ACD

**Description:** Subwatershed studies identify projects to improve water quality and rank them by cost effectiveness. The process includes identifying a priority waterbody, watershed delineation, identifying projects, cost estimates, and modeling benefits.

**Purpose:** To allow prioritization of the most cost effective water quality projects.

**Results:** In 2023 the Anoka Conservation District is working on subwatershed studies for Ford Brook, and direct drainage areas to the Rum and Mississippi Rivers. The areas are discontinuous because some areas were previously studied, do not directly discharge to the waterbody of interest, or have little or no stormwater infrastructure. Among the studied areas, some areas have more analysis due to the number of possible projects identified and direct discharge into the priority waterbody.

Each of these studies is underway and will be completed in 2024. Funding is from a Rum metro Watershed Based Implementation Funding grant and match from the Upper and Lower Rum River WMOs.

# *URRWMO Annual Report to BWSR and State Auditor*

**Partners:** URRWMO, ACD

**Description:** The URRWMO is required by law to submit an annual report to the Minnesota Board of Water and Soil Resources (BWSR). This report consists of an updated list of all URRWMO Board members, work activities related to the URRWMO Watershed Management Plan, current status of municipal water plans, financial summaries, and other work results. The report is due annually, 120 days after the end of the URRWMO’s fiscal year (April 30th). The URRWMO must also submit an annual financial report to the State Auditor. This includes submitting a financial report and filling out a multi-worksheet form.

**Purpose:** To document progress toward implementing the URRWMO Watershed Management Plan and to provide transparency of government operations.

**Location:** Watershed-wide

**Results:** ACD prepared the URRWMO annual report to BWSR and reporting to the State Auditor. They are available on the URRWMO website.

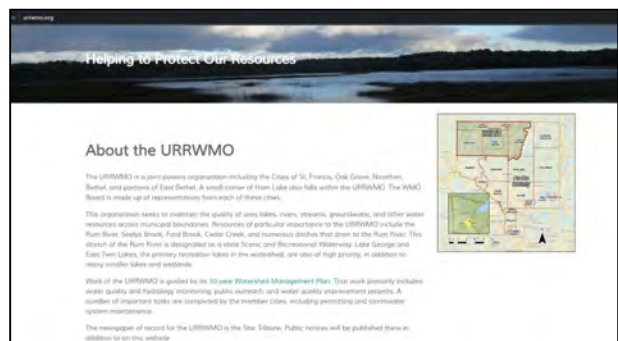

# Administrative Services

- Partners:** URRWMO, ACD
- Description:** ACD serves as the URRWMO Watershed Coordinator, providing a variety of administrative services. Tasks are limited to those defined in the contractual agreement.
- Purpose:** To facilitate the day-to-day operations of the URRWMO.
- Results:** Administrative assistance provided to the URRWMO by ACD included:
- Prepared meeting packets for and facilitated URRWMO meetings.
  - Developed annual budgets.
  - Prepared URRWMO activity summary report for board members and cities.
  - Requested & received biomonitoring funding for the American Legion.
  - Represented URRWMO interested during Watershed Based Implementation Funding meetings.
  - Worked to city bring ordinances into compliance with URRWMO standards.
  - Presented amendments to the URRWMO joint powers agreement.
  - Fielded questions from developers, the county highway department, and others regarding URRWMO stormwater and wetland standards.
  - Facilitated the URRWMO technical advisory committee.
  - Fielded requests from the City of Anoka for Anoka dam project support.
  - Insurance renewal.
  - Board tour of projects.
  - Fielded community concerns about URRWMO funding mechanisms.
  - Created a reorganized ledger and treasurer’s report form.

## Website

- Partners:** URRWMO, ACD
- Description:** The URRWMO contracts ACD to maintain the URRWMO website.
- Purpose:** To increase awareness of the URRWMO and its programs. The website also provides resources that helps users better understand water resource issues in the watershed.
- Locations:** [www.URRWMO.org](http://www.URRWMO.org)
- Results:** In 2023, ACD maintained the existing URRWMO website, paid the domain registration and hosting fees, and posted meeting minutes and agendas.

# Newsletters

- Partners:** ACD, URRWMO
- Description:** ACD develops LRRWMO outreach pieces, required by the state, such as newsletter articles or infographics. Topics have included stormwater management, wetland regulation and protection, water quality best management practices, septic fix-up funding opportunities, groundwater, watershed planning, and others.
- Purpose:** To increase public awareness of the URRWMO and its programs.
- Location:** Watershed-wide
- Results:** ACD prepared two articles/infographics for the URRWMO in 2023. The topics included septic system fix-up grants and local water recreation opportunities. Articles were printed in partnering city newsletter

## PRESS RELEASE

**Contact:** Jamie Schurbon, Watershed Projects Manager  
**Date:** February 3, 2023

### Local Waters Offer Opportunities

Our community has an abundance of local waters offering recreational opportunities. Within a few minutes' drive you'll find a state designated scenic and recreational river, bigger lakes, small hidden waters only reachable with a canoe, and more. Each offers something a little different: quiet paddling, water sports, a public beach, waterfowl hunting, or fishing. The trick is finding the spot that matches your dream "day off."

Amongst our local waters, here are some top picks sorted by activity:

<b>Fishing-</b>	Rum River & Lake George.
<b>Swimming-</b>	East Twin Lake has a nice smaller beach. Lake George has a large beach. There is a park entry fee.
<b>Water sports-</b>	Lake George offers the biggest open water area.
<b>Hunting-</b>	Cedar Creek Conservation Area is located along the Rum River and accessed from County Road 9.
<b>Quiet paddling-</b>	The Rum River. See the Rum River State water trails maps on the DNR website.
<b>Bird Watching-</b>	Rum River North or Central County Parks offer lots of trails along the Rum River.
<b>Winter fun-</b>	The Anoka County Chapter of Pheasants Forever hosts and annual "Pheasants on Ice" at Lake George in February.

Before leaving home, you can learn more about a lake online.

- ✓ Homesteaded single family homes or duplexes in Anoka Co.
- ✓ Must have been inspected and issued a certificate of non-compliance.
- ✓ May NOT be used for tank pumping or other maintenance.
- ✓ Household must meet low income thresholds. Grant covers up to 90% depending on income.
- ✓ Funding is limited and may vary by location. Shoreland areas or projects providing the greatest health and environmental benefits may be preferentially funded.
- ✓ See all program requirements at [www.AnokaSWCD.org](http://www.AnokaSWCD.org) under "financial assistance."

Contact Kris Larson at the Anoka Conservation District.  
 763-434-2030 ext 110 or [kris.larson@anokaswcd.org](mailto:kris.larson@anokaswcd.org)

# *Outreach and Education*

- Partners:** ACD, Anoka County, WMO’s, watershed districts, cities and townships
- Description:** ACD conducted public outreach and education including newsletter articles, workshops, community events, and others. Each effort is intended to reduce work needed by cities and avoid duplication. There are multiple funding sources including cities, watershed organizations, ACD, and Watershed Based Implementation Funding from the State.
- Purpose:** To inform community residents, businesses, staff, and decision-makers about issues affecting local waterbodies and groundwater resources. To achieve behavioral changes that improve water quality and recruit people to install water quality projects.
- Location:** Watershed wide
- Results:** Outreach efforts are collaborative. Some tasks are exclusively performed by ACD for the URRWMO. The URRWMO also provides funding to support the Anoka County Water Resources Outreach Program which uses funds pooled from various sources to perform regional outreach used in multiple watersheds. Finally, the URRWMO area benefits from outreach by the Rum River Watershed Partnership.

2023 accomplishments included:

## **Projects promotion**

- Neighborhood-wide rain garden promotion in the 225<sup>th</sup> Lane area of St. Francis. Approximately 12 direct conversations were done with landowners.
- Wetland restoration outreach to specific properties in the Ford Brook subwatershed and along the Rum River.

## **Workshops promotion**

- Smart Salting – Distributed information to community public works departments about this training and certification program from the MPCA.
- Cover Crops & Soil Health – Promoted a workshop to agricultural producers. Funded by the Rum River Watershed Partnership.

## **Community events**

- Lake George groups meeting – ACD staff presented about water quality improvement efforts at a joint meeting of the Lake George Conservation Club and Lake Improvement District.

## **Other**

- Videos – The “Our Waters” video series which the URRWMO contributed to produce received national press. The “Our Groundwater Connection” video was used by Ohio TV news to help explain groundwater contamination from the East Palestine train derailment.
- Local Officials Education about Land Use Planning – A new video entitled “When Development Comes to Town” was promoted to elected officials and planning/zoning committees. The video was funded by the Lower St. Croix Partnership.
